

Starting Guidelines:

1. How I can import project at Android Studio?

- After purchasing 'Company Profile' template from codecanyon the first task is to import the project in android studio so that you can modify the code as you want. We recommend to use **Android Studio 2.0** (preview version) to work with our source code. After installing Android Studio open it. From welcome screen select **Open an existing Android Studio project** → select downloaded source code and press OK. Android Studio will take care of building the projects.

2. How I can change the app name?

- After successful import on android studio go to **res** → **values** → **strings.xml** from project tab on left side bar. After opening **strings.xml** you will get lots of **name** attribute with **<string></string>** tag. Now press ctrl+R and type **app_name**. Result will be shown with highlighted effect. Now replace **Audacity** with your company name!

3. How I can change the package name of the project?

- For changing the package name to your desired one you have to go to **Gradle Scripts** → **build.gradle (Module: app)** file and find for the keyword **applicationId** and change the value **com.audacityit.audacity** with your desired app id. Remember that the app id should be unique because google play and android device will recognize your app using this app id. If duplication found you won't be able to upload your app to google play.

4. How I can change the app logo?

What is the required size of app logo?

What image format I should to use for app logo(jpg/png)?

- Now time to change the app logo (launcher icon). For changing the icon go to **New** → **Image Asset** by right clicking on **app** from **project** tab. You will get new window here. Keep unchanged the **Asset Type** to **Launcher Icons**. Now browse to your icon by pressing ... button on right most side of **Image File** section. You will see a preview of your icon you selected. You can change the decoration using several option as your wish. Now press **Next** and **Finish** to effect the changes. App icon is changed now!

- You can also import app icons manually. For that you've to design 5(five) icons of different sizes of your company logo. Sizes are given below. Remember to rename the icons name by **ic_launcher**. Paste those files into **res** → **mipmap** according to different dpi version you made. It will replace the the existing icons with your newly designed app icon.
 - 48 x 48 (mdpi)
 - 72 x 72 (hpdi)
 - 96 x 96 (xhdpi)
 - 144 x 144 (xxhdpi)
 - 192 x 192 (xxxhdpi)
 - It is recommended to use launcher icons in png format.
5. How I can translate project to my language (RTL-Support)?
- Currently this feature (RTL-Support) is not available. But if you want to add this feature you've to make necessary resources and modify the data structure by yourself.
6. Is Google Analytics is available to the project ? If yes, how to use it ?
- Yes. Google Analytics is already implemented with screen and event tracking functionality. Active your app profile from [here](#) and collect your **app tracker id** (ga_trackingId i.e: UA-XXXXXXXX-X).
 - Now go to res → xml → app_tracker.xml and search for **your_tracker_id** and replace it with your own **app tracker id**.

Splash Page:

1. How I can change my splash screen background colour?
- Open **ColorUtil** by going to **app** → **java** → **com** → **audacityit.audacity** → **util** → **ColorUtil**. How I can change my splash screen background colour? Search for **SPLASH_SCREEN_COLOR** and change **#13153E** to your desired hexadecimal color.
2. How I can change my splash screen company logo?
- Goto **res** → **drawable** and replace **app_inside_logo.png** with your company logo for splash screen. Remember to keep the same name which you want to replace. Otherwise the logo will be unchanged. Paste your logo there. If **Choose Destination Directory** window appear always choose **.../app/src/main/drawable-xhdpi** as the destination folder. This

folder is recommended as the destination folder for image resources we will change from now.

3. What is the required size of splash screen company logo?

- We are using **app_inside_logo.png** as company logo inside app. This logo becomes responsive in size when run on large screen device like tab. Also it is using in two(2) more separate screens. So we've used comparatively high resolution image to meet the requirement with only one image. We are using 865 x 490 pixel. We will not suggest you to fix the image dimension in a specific size but try to keep the aspect ratio as we used in our icon.

4. Can change the whole app color scheme?

- You can change the color scheme by changing the color value of different attribute name. For that open colors.xml by going to **res** → **values** → **colors.xml** from project tab on left side bar. You will find **toolbarColor**, **statusBarColor**, **activityColor** (background color of the content screen). You can change those corresponding hexadecimal values with your preferable color.

Left navigation drawer:

1. How I can change the left navigation drawer header background image and company logo? What is the required size of those images?

- You can change the header background image by changing/replacing **img_nav_header.jpg** in **res** → **drawable** folder. You can use .png image here but before doing that you've to delete the existing **img_nav_header.jpg** image first. Always try to keep the same name of the image whatever you're replacing otherwise the change will not be affected. Here we have used 400 x 226 px image. You can use your own size. But we highly recommend to not to use very high resolution image. Also keep concern about the aspect ratio. You can follow our given size.
- The company logo used in splash screen (see **Splash Page** FAQ 2) is also using in this section. So If you've already changed the logo and don't want to change it any more you can skip this step. But if you want to change the logo you should import a new logo to the **res** → **drawable** folder and refer the file name you imported to the **nav_header_layout.xml** line number 18 (Go to **res** → **layout** → **nav_header_layout.xml**) . Just replace **app_inside_logo** with your image file name. Please avoid to put the file type here (i.e: app_inside_logo.png). Check out [this](#).

- To change header view height goto **res** → **dimens.xml** and double click to open the file. You will get **header_view_height** with value **150dp**. Change the value(i.e: 170dp, 190dp etc.) followed by **dp**. **dp** is the unit. So don't remove **dp**.
 - You can also change header view company logo size. Just follow as described in previous step. Change the value of **header_view_logo_width** and **header_view_logo_height**.
2. How I can change the phone number, e-mail and website url?
- Go to **res** → **values** → **strings.xml** and search for **dev_phone**, **dev_mail**, **dev_web_page**. Change the corresponding values with yours.
3. How I can change the component icon at the left navigation drawer and what is the required size?
- Go to **res** → **drawable** and you find several icons starting with the text **ic_nav_**. These icons are related to the navigation view (sidebar). You can change the icons by replacing those with your icons. We highly recommend to use 48 x 48 px (xhdpi) image for sidebar icons. Also recommended to use **white color transparent background** icon for sidebar. Otherwise the selection color (when user select a option from sidebar) will not work.
4. How I can change the component icon/text default color and selection color ?
- Go to **app** → **java** → **com** → **audacityit.audacity** → **util** → **ColorUtil** and find there:-
- NAV_ICON_COLOR_NORMAL** (icon normal color),
NAV_ICON_COLOR_CHECKED (icon checked color),
NAV_TEXT_COLOR_NORMAL (text normal color),
NAV_TEXT_COLOR_CHECKED (text checked color).
- Change the corresponding color with your preferable color.
5. May I change the component name at the left navigation drawer and how?
- Goto **res** → **menu** → **nav_menu_drawer.xml**. You will find the options shown in navigation drawer in the **<item>** tag with **id**, **icon** and **title**. You can change the title by editing **android:title** attribute. For example you want to change the **Clients** name. Do the modification at line number 25 as [here](#).

6. Can I hide any item if I don't want to show at the left navigation drawer and how?
- Yes you can. If you don't want to show an item in drawer you can easily hide an item. For that you've to comment out the corresponding **<item>** block. You've to select the whole **<item>** block and press **ctrl+/** key on keyboard. For example If you want to hide **Methodology** you can do as [here](#).
7. May I add more components/options at the left navigation drawer and how?
- Sorry, right now we don't have support to do that. But if you're a developer you can do the modification easily.

Homepage:

1. How I can add or delete project in app homepage?
- We are using **JSON** (JavaScript Object Notation) for managing the data structure in our template. You can easily insert/update data if you've minimum level of knowledge of how to work with JSON.
 - You can easily add or delete project by editing json file associated with homepage. For that go to **app** → **assets** → **json** → **home**. You will find some json text there. This is a json array with the name **projects** which holds several projects shown in the homepage. If you want to add or delete project you've to identify a single project on that file. Check this [out](#). You can identify the starting and ending clause as shown in the image. Every project declaration is separated by a comma except the last project. Check this [out](#). Every project has its own **name**, **image**, **project_info** (a jsonarray collection of **platform** and **url**). Here image value (i.e: **img_home_5**) describe the filename of the image that are located on the **drawable(xhdpi)** folder under **res**. If you are okay with the above discussion you are good to edit our json files.
 - For adding a new project see [this](#). We created a new project by adding new project property like **name** as **Your Project Name**. You will name it according to yours. We inputted an **image** with the name **img_your_project**. Change the name according to yours and don't forget to keep the image file in the **res** → **drawable** folder. If the name written in the json file and the name of the image mismatch then image will not be shown on screen and exception may occur. Do it **carefully**!
 - Now suppose we want to add new platform info in our newly added project. Check out [this](#).

- Now suppose we want to delete an existing app, for example: **Amar Phonebook**. For that check this [out](#).
2. How I can change the project image, title, platform name and project url at home page?
 - If you are okay with step 1 you've already done this. Thereafter we are explaining. You can change the image name easily by changing the name of **image** field. But before that make sure you've putted the image in the **res** → **drawable** folder with the same name mentioning in the json file.
 - Change project title by changing the value of the **name** field.
 - Change project platform name and url by changing the value of **platform** and **url** field respectively.
 - Check this [out](#).
 3. What is the required size of the home page image?
 - As the images are shown in portrait view we used portrait images (resolution 640 x 1138 px). We suggest you to keep portrait image aspect ratio and file size should be not more than 150KB for better performance.

Overview Page:

1. How I can change the background image, company icon, name and slogan ?
 - Go to **app** → **assets** → **json** → **overview** json file and you can edit your necessary changes easily. But keep in mind to put the image files in the **res** → **drawable** folder.
 - Json fields and their usage are given below:-
 - company_icon**: Filename of the logo shown in overview page.
 - background_image**: Filename of the image shown in background of the upper part of the overview page.
 - company_name**: name of the company you want to display at overview page. Change according to yours.
 - company_tag**: slogan of your company.
2. What is the required size for background image and company icon ?
 - We recommend to follow the aspect ratio of the background image we used. We used **img_overview_parallax** as background image. Try to keep the file size not more than 150 KB.
 - We are using **ic_overview_company** (200 x 200 px) as company icon. You can follow the resolution, padding for best fitting your logo into screen.

3. How I can change the numeric value? How I can change the numeric value's component like Completed, In queue and waiting section?
 - You can change numeric values by editing **number** and **text** field. Check this [out](#). You will see there are three(3) counter info has identified. We restrict the counter info into three items because **we are supporting only three items to show there**. So we recommend to use three counter items. If you want to display less than 3 items the view will look empty and frail.
 - change **number** value (i.e: 20+/3/10+) and **text** field like (i.e: Completed, Developing, In Queue). Keep in mind that the **text** value will be shown with a new line after the **number** field. Check this [out](#).
4. Can I add overview item and how? What is the item's image size?
 - You can add as many items you want to the json. You've to add **title**, **body** and **image** inside **basic_info** jsonarray as a new info. Where **image** represent the info icon for the specific info. Check out [this](#). If you want to add multiline text in **body** field you should add \n symbol before the new line. Check this [out](#).
 - We recommend to use exact 48 x 48 px image for the info icon. Don't forget to put those icon files into **res** → **drawable** (xhdpi) folder.

Portfolio page:

1. How I can add project at portfolio page?
 - You can easily do that by going to **app** → **assets** → **json** → **portfolio** file. Suppose we want to add a new project which will be shown at the first row of the list. Check this [out](#).
2. What's the image size of project item, how to add project name and new platform of project?
 - We've used image files name starting with **img_portfolio_** (i.e: img_portfolio_1.jpg, img_portfolio_2.jpg etc.). Try to keep the aspect ratio (i.e: 655 x 327 px) we maintained and the image format should be **JPG**. The file size should be as little as possible. Because **large file size can produce lag while scrolling at portfolio screen**.
 - For adding new project name and new platform check [this](#) out.

3. How to change filter's(Floating Action Buttons) item name? How to add or remove? What's the size of icon in filter list?
 - If you want to change the root menu icon just rename your desired icon into **ic_fab_filter** and paste(replace) it into **res** → **drawable**(xhdpi) folder.
 - You can easily do that by going to **app** → **assets** → **json** → **filter** file. Just edit the **title** fields.
 - For add or remove FAB items check this [out](#).
 - For FAB icon use 48 x 48 px icon.
4. How I can change FAB icon background color and pressed color ?
 - Just change the **menu_color** and **menu_pressed_color** field carefully. Input the color code with hexadecimal format.
5. How I can add share option in portfolio ?
 - We don't allow to add share option in portfolio to share app. If you want to do so you need to do some coding. But we will include this feature in next release.

Team:

1. How I can add more or delete existing team members? How to change image, Name & Designation fields.
 - Go to **app** → **assets** → **json** → **team** and follow [this](#).
 - Just edit **name** (For member name), **designation**, **image** (file name for member icon) fields.
2. What is the required size to change the image of the team members?
 - We are not recommending any fixed size for that. You can follow ours. But try to keep file size smaller for better performance. It's **not mandatory to use circle icons**. The app will make circle icons programmatically.

Clients:

1. How I can change the client's company logo of the clients page? What is the required size of the logo ?
 - Go to **app** → **assets** → **json** → **client** and change the value of the **image** field.
 - We recommend you to use approx. 100 x 100 px image for clients logo. Also try to keep file size smaller.

2. How I can change the client's name, delegate name, country & platform of the project with URL?

- You will find every client [block](#) with the following property. change the respective values according to yours.
client_name: this field is for the name of the client/company your company worked for.
delegate_name: delegate name on behalf of the company
country: company region
image: image file name of the client/company
platform: name the platform your company worked for the client/company.
url: url the project your company worked for the client/company.

3. How to add new platform ?

- Check [this](#) out.

Testimonial:

1. How I can change the delegate's image and what is the required size?

- Go to **app** → **assets** → **json** → **testimonial** and change the value of the **delegate_image** field.
- Try to use square size image with a small file size for better view and performance. We are using 110 x 110 px image.

2. How I can change the delegate's name , designation and comments ?

- Just change the value of **delegate_name**, **delegate_designation** and **comment** field.

3. What is reference url and how I can change it ?

- reference url is the web url where user will be redirected when tap on world icon on the list item on testimonial screen.
- You can change it according to yours by changing the value of **ref_url** field.

4. How I can add a new testimonial or delete a old one ?

- Check out [this](#).

Methodology:

1. How I can change the background image and what is the required size? Should I have change the logo of the company or it will get from previous company logo?
 - If you've already set the header background and header company icon in **Left navigation drawer** part you don't need to change to set it here. Because we are using the same image here also. But if you want to set different one you've to go to **app** → **assets** → **json** → **methodology** and change the value of the **background_image** and **company_icon**. Put those image files into **res** → **drawable**(xhdpi) folder too.
 - If you have not changed the image you can skip this step. Here we have used 400 x 226 px image for the **background_image**. You can use your own size. But we highly recommend to not to use very high resolution image. Also keep concern about the aspect ratio. You can follow our given size.
 - If you have not changed the image you can skip this step. We are using **app_inside_logo.png** (865 x 490 pixel) as company icon. We will not suggest you to fix the image dimension in the specific size but try to keep the aspect ratio as we used in our icon.
2. How I can change the text of the content heading and description?
 - Go to **app** → **assets** → **json** → **methodology** and change the value of the **heading** and **description** field.
3. How I can change the content heading icon and what is the required size?
 - Just change the image field value with with your icon name.
 - We recommend to use exact 48 x 48 px image for the info icon. Don't forget to put those icon files into **res** → **drawable** (xhdpi) folder.

Social:

1. How I can change the social media's url?
 - Go to **res** → **values** → **strings.xml** and change the following attribute name value: **dev_fb**, **dev_linked_in**, **dev_twitter**, **dev_youtube**. Check out [this](#).
2. Am I available to add more social media URL? If yes how? And what's the size of image?

- No, You are not supposed to add more social url. We will add this feature in future release. But if you want to add social url as your choice you have to change the associated layout file(**res** → **fragment_social.xml**) and also some programming on **app** → **java** → **com** → **audacityit.audacity** → **fragments** → **SocialFragment** .

FAQ:

1. How I can change the question and answer of the FAQ?
 - Go to **app** → **assets** → **json** → **faq** and edit the value of the **q** field for question and **a** field for answer.
